ADDRESS TO: Assistant Commissioner for Patents
Box Patent Application
Washington, D. C. 20231

APPLICATION ELEMENTS

See MPEP chapter 600 concerning utility patent application contents.

1. X Fee Transmittal Form
(Submit an original, and a duplicate for fee processing)
2. X Specification (Total Pages 18)
(preferred arrangement set forth below)
 - Descriptive Title of the Invention
 - Cross References to Related Applications
 - Statement Regarding Fed sponsored R & D
 - Reference to Microfiche Appendix
 - Background of the Invention
 - Brief Summary of the Invention
 - Brief Description of the Drawings (if filed)
 - Detailed Description
 - Claims
 - Abstract of the Disclosure
3. X Drawings(s) (35 USC 113) (Total Sheets 4)
4. Oath or Declaration/Power of Attorney (Total Pages)
 - a. Newly Executed (Original or Copy)
 - b. Copy from a Prior Application (37 CFR 1.63(d))
(for Continuation/Divisional with Box 17 completed) (**Note Box 5 below**)
 - i. DELETIONS OF INVENTOR(S) Signed statement attached deleting inventor(s) named in the prior application, see 37 CFR 1.63(d)(2) and 1.33(b).
5. Incorporation By Reference (useable if Box 4b is checked)
The entire disclosure of the prior application, from which a copy of the oath or declaration is supplied under Box 4b, is considered as being part of the disclosure of the accompanying application and is hereby incorporated by reference therein.
6. Microfiche Computer Program (Appendix)
7. Nucleotide and/or Amino Acid Sequence Submission
(if applicable, all necessary)
 - a. Computer Readable Copy
 - b. Paper Copy (identical to computer copy)
 - c. Statement verifying identity of above copies

09/29/00 09/29/00

ACCOMPANYING APPLICATION PARTS

8. _____ Assignment Papers (cover sheet & documents(s))
9. _____ 37 CFR 3.73(b) Statement (where there is an assignee)
10. _____ English Translation Document (if applicable)
11. _____ a. Information Disclosure Statement (IDS)/PTO-1449
_____ b. Copies of IDS Citations
12. _____ Preliminary Amendment
13. X _____ Return Receipt Postcard (MPEP 503) (Should be specifically itemized)
14. _____ a. Small Entity Statement(s)
_____ b. Statement filed in prior application, Status still proper and desired
15. _____ Certified Copy of Priority Document(s) (if foreign priority is claimed)
16. X _____ Other: Unsigned Declaration and Power of Attorney

17. If a **CONTINUING APPLICATION**, check appropriate box and supply the requisite information:
 _____ Continuation _____ Divisional _____ Continuation-in-part (CIP)
 of prior application No: _____

18. Correspondence Address

MECHANISM FOR LOCKING CLIENT REQUESTS TO A PARTICULAR SERVER

COPYRIGHT NOTICE

Contained herein is material that is subject to copyright protection.

- 5 The copyright owner has no objection to the facsimile reproduction of the patent disclosure by any person as it appears in the Patent and Trademark Office patent files or records, but otherwise reserves all rights to the copyright whatsoever.

FIELD OF THE INVENTION

This invention relates to the field of server load balancing, Internet quality of service, and security and more specifically, to a mechanism for locking client requests to a particular server.

BACKGROUND OF THE INVENTION

- The demand for e-commerce brings a unique set of challenges to network infrastructures. For example, one server may be inadequate to provide the required capacity and scalability to serve the increasing size of e-commerce transactions. Server load balancing (SLB) was developed to overcome this problem, where a number of servers (server farm) act as a single server and a special device (dispatcher) dispatches requests to server in a manner that balances the load on all the servers in the serve farm. Some SLB schemes may dispatch requests to the server having the least load, and other SLB schemes may dispatch requests to any server such that the network is optimized, for example. For purposes of simplicity, the server selected by any given SLB scheme is referred to herein as the "best server".
- 20
- 25

In e-commerce transactions hosted on a website, however, SLB

introduces a new problem. When a customer sends information to a website that utilizes an SLB scheme, the information is sent to the best server computed by the dispatcher, Server A, and stored locally on that server. For example, a customer of Amazon.com® selects books and places them in the shopping cart, and then decides to visit other areas of the site before purchasing. When the customer returns to the shopping cart, effectively to access state information (the state of previously stored information), the SLB scheme again computes the best server, this time Server B, to direct the customer's request to. Since the distribution of requests amongst the servers in the server farm may have changed since the customer's last request, the best server on the subsequent request is different from the best server on the first request. Consequently, the customer's information does not exist on Server B, and the shopping cart may be empty when the customer returns to it.

One current solution to this problem is to globally maintain state information, such that the state information can be accessed by any server in the server farm. For example, state information can be maintained in a special state server, or even one of the servers in the server farm. One of the disadvantages to this, however, is the latency associated with memory accesses by the servers, as well as dispatcher latency associated with storing state information.

[illegible]

FIG. 1 illustrates an exemplary server load balancing (SLB) environment in which preferred embodiments of the present invention are operable.

FIG. 3 is a method of preferred embodiments of the invention.

10

DETAILED DESCRIPTION OF THE INVENTION

In one aspect of the invention, a method for directing requests from the same client in a single session to the same server in secure e-commerce transactions is described. In one exemplary use for this method, a user submits state information, hereinafter referred to as a client request, over the Internet to an e-commerce website, such as Amazon.com®, and the state information is stored on a system server. The e-commerce website comprises a dispatcher (a system for sending client requests to a server) and server farm (a pool of a plurality of servers for processing client requests). The client request is received by the dispatcher, and a unique session identifier (I.D.) is assigned to the client request. The dispatcher selects a server to send the client request to, and sends the client request to the selected server. The session I.D. is mapped to a server identifier associated with the selected server.

In preferred embodiments, when the client request is received by the dispatcher, the dispatcher establishes a secure connection, preferably SSL (Secure Sockets Layer), with the client. The dispatcher then uses a load balancing algorithm to determine the best server in the server farm to send the client request to. The unique session I.D. is then mapped to an SSL context, which identifies a previously existing SSL tunnel between the dispatcher and the selected server, such that subsequent requests having the same session I.D. can be directed to the same server via the SSL tunnel.

The present invention includes various operations, which will be described below. The operations of the present invention may be performed by hardware components or may be embodied in machine-executable instructions, which may be used to cause a general-purpose or special-purpose processor or logic circuits programmed with the instructions to perform the operations. Alternatively, the operations may be performed by a combination of hardware and software.

The present invention may be provided as a computer program product,

which may include a machine-readable medium having stored thereon instructions which may be used to program a computer (or other electronic devices) to perform a process according to the present invention. The machine-readable medium may include, but is not limited to, floppy diskettes, optical disks, CD-ROMs, and magneto-optical disks, ROMs, RAMs, EPROMs, EEPROMs, magnet or optical cards, flash memory, or other type of media / machine-readable medium suitable for storing electronic instructions. Moreover, the present invention may also be downloaded as a computer program product, wherein the program may be transferred from a remote computer (e.g., a server) to a requesting computer (e.g., a client) by way of data signals embodied in a carrier wave or other propagation medium via a communication link (e.g., a modem or network connection). Accordingly, herein, a carrier wave shall be regarded as comprising a machine-readable medium.

Introduction

FIG. 1 illustrates an exemplary environment in which preferred embodiments of the present invention are operable. A user on a client system 100 logs into a server system 116 to conduct transactions, such as to browse the contents of a website, purchase goods from a website, or request information from a website. The server system 116 comprises a dispatcher 104 and a server farm 106 comprising a plurality of servers 108, 110, 112, 114. The dispatcher receives user requests to process transactions and selects one of the servers 108, 110, 112, 114 to send a given user request to. On a first session of a given user, the dispatcher 104 preferably selects a server 108, 110, 112, 114 from the server farm by using a load balancing algorithm to find the best server. Preferably, the dispatcher selects the same server that was selected for the user's first session on subsequent sessions for the same user if the request comprises secure information.

FIG. 3 outlines a method of the present invention starting at block 300. A first user request comprising a session I.D. is received at block 302. At block

304, it is determined if the transaction is a secure transaction. If it is, then at block 306, it is determined if the session I.D. exists in the mapping table. If the session I.D. does not exist in the mapping table, or if the transaction is not secure, then at block 310, a load-balancing algorithm is used to find the best server. Furthermore, the user request is sent to the best server at block 312. If the user request is a secure transaction, then at block 314, the mapping table is updated to include an entry for the session I.D. and the corresponding SSL context for the selected server.

If the transaction is secure and the session I.D. exists, then at block 308, the session I.D. is searched for in the mapping table, and the request is sent to the server corresponding to the session I.D. The method ends at block 316.

Secure Transactions

In preferred embodiments, the dispatcher distinguishes between secure and non-secure transactions. Secure transactions may be determined by the server system. For instance, secure transactions may be determined to comprise credit card transactions, a user's personal information, or user reviews. Non-secure transactions may be determined to comprise a user request for a book rating, for instance. As described herein, secure transactions refer to transactions in which information needs to be saved. Such information, such as personal data, and credit card information, is referred to as state information.

If a user request is determined to be a secure transaction, the dispatcher processes the request differently than if the request were a non-secure transaction. In preferred embodiments, the dispatcher 104 has previously existing SSL (Secure Sockets Layer) tunnels and corresponding SSL contexts 118, 120, 122 with the servers 108, 110, 112, 114 in the server farm 106 to handle secure transactions. An SSL tunnel is a designated channel of communication, and a corresponding SSL context comprises a source IP (Internet protocol) address, a destination IP address, and an encryption algorithm

that identifies a corresponding SSL tunnel.

Initial User Session Requests

When the user logs onto a website associated with a server system 116 to conduct a secure transaction, as shown in FIG. 2, the dispatcher 104 looks in a mapping table 204 to determine if the session I.D. has already been mapped to a specific server. If not, an SSL tunnel and corresponding SSL context 200 between the dispatcher 104 and the client 100 is created. The SSL context between the client 100 and the dispatcher 104 additionally comprises a session I.D. to uniquely identify the user's current login session. For example, a user logs onto Amazon.com®, places items in the shopping cart, submits the items for payment, and then decides to continue browsing the site.

The dispatcher 104 uses a load-balancing algorithm (by employing a load balancer, for instance), to find which one of the servers 108, 110, 112, 114 in the server farm 106 can best handle the current user request. As discussed, *supra*, the best server can be the server currently having the least load, or the server which can best alleviate network traffic, for instance. A load-balancing table 202 is updated accordingly.

Once a best server is determined, the user request is sent to the selected server 108. The dispatcher then maps the current session I.D. to the SSL context between the dispatcher 104 and the selected server 108 by adding an entry to a mapping table 204 for the session I.D. and the SSL context. The selected server receives the user's request, and stores corresponding information in its local memory for subsequent access.

Subsequent User Session Requests

When the user makes another request, (for example, the user has finished browsing the site and wishes to return to the shopping cart previously submitted), the dispatcher receives the subsequent request. Using the session I.D. from the

user request, the dispatcher 104 determines if the session I.D. exists in the mapping table 204. If the session I.D. exists in the mapping table 204, then the dispatcher sends the user's subsequent request to the server corresponding to the session I.D. as indicated by the mapping table 204. Since the previously submitted information is stored on this server, the user's information is quickly accessed on the server, and available to the user.

If the session I.D. does not exist in the mapping table 204, then processing proceeds as described for an initial user session request, *supra*.

Quality of Service

Where multiple requests are received on the same SSL tunnel between the dispatcher and a given server, a QoS (Quality of Service) Manager uses predetermined algorithms to aggregate multiple streams into a single stream. In reference to FIG. 4, when multiple clients, such as Client 1 404, and Client 2 402, are directed to the same server via an SSL tunnel, as determined by the load balancer 204, a QoS Manager 400 decides which client gets priority of the SSL tunnel. An exemplary algorithm used by the QoS Manager can be found in pending United States patent application entitled "Secure Communications Over Unsecure Links" by Manav Mishra, Raj Yavatkar, and Prakash Iyer, filed on September 5, 2000, serial no. _____.

FIG. 4 further illustrates that when Client 1 404A, 406A submits a request to the dispatcher 104, Client 1 may submit a secure transaction 404B or a non-secure transaction 406B. If Client 1 submits a non-secure transaction, then a load balancer 204 determines which server in the server farm the client request is to be sent to via the current SSL connection 406B. If Client 1 submits a secure transaction, then a mapping table 204 is searched to determine if a session I.D. associated with Client 1 exists in the table. If it does, then the client request is sent to the server corresponding to the session I.D. in the mapping table 204. If the session I.D. does not exist, then a load balancer 410 uses a load balancing

table 202 to determine which server in the server farm to direct the client request to. Client 1 request is then sent to the selected server 408.

Where a second client, Client 2 402A, makes a client request and the load balancer 410 directs Client 2 request to the same server as Client 1, both requests 404B, 402B are sent to a QoS Manager 400 and, the QoS Manager decides which request to handle first. In the example of FIG. 4, Client 1's secure request 404B is a high-priority SSL request, and Client 2's secure request is a low-priority SSL request. The QoS Manager 400 then processes the requests according to their priorities, such that Client 1 404B receives a high-priority SSL connection with one of the servers in the server farm 408, and Client 2 402B receives a low-priority SSL connection with one of the servers in the server farm 412.

Non-Secure Transactions

In one embodiment, if a user request is determined to be a non-secure transaction, the dispatcher processes all user requests in the same way. In other words, the dispatcher uses a load balancing algorithm to find the best server, and forwards all requests to the best server determined at the time a request is received.

In other embodiments, non-secure (non-SSL) transactions can always be mapped to the same server using the scheme for secure transactions by using a cookie, or a block of data, as the session I.D. (rather than the SSL context in the case of a secure transaction). The cookie would be generated by the best server and returned to the client. When another client request is made from the same client, the cookie comprises information about the server that generated the cookie so that the request can be sent to the original server.

Conclusion

As described in embodiments of this invention above, the latency

associated with global accesses is alleviated, since information is locally stored at selected servers. Moreover, there is no loss of information since the same server is selected to process user requests.

5 In the foregoing specification, the invention has been described with reference to specific embodiments thereof. It will, however, be evident that various modifications and changes may be made thereto without departing from the broader spirit and scope of the invention. The specification and drawings are, accordingly, to be regarded in an illustrative rather than a restrictive sense.

10 For example, while embodiments herein have been described to distinguish between secure and non-secure transactions, the invention can be implemented without making this distinction. In other words, regardless of the type of user request, the dispatcher may forward all user requests in the same session to the server for processing.

WHAT IS CLAIMED IS:

- 1 1. A method comprising:
 - 2 receiving a first request comprising a session identifier (I.D.);
 - 3 assigning a unique I.D. to the first request;
 - 4 selecting one of a plurality of servers to process the first request;
 - 5 assigning the unique I.D. to the selected server; and
 - 6 sending the first request to the server.
- 1 2. A method as in claim 1, additionally comprising:
 - 2 subsequently receiving a second request comprising the session I.D.;
 - 3 selecting the server that the session I.D. is assigned to; and
 - 4 sending the second request to the server.
- 1 3. A method as in claim 1, wherein said selecting one of a plurality of servers
 - 2 to process the first request comprises using a load balancing algorithm to
 - 3 determine a server to the first request to.
- 1 4. A method comprising:
 - 2 receiving a first request comprising a session identifier (I.D.);
 - 3 selecting one of a plurality of servers to process the first request;
 - 4 mapping the session I.D. to the selected server;
 - 5 sending the first request to the selected server;
 - 6 subsequently receiving a second request comprising the session I.D.;
 - 7 determining that the second request comprises secure information;

- 8 selecting the server that the session I.D. is assigned to; and
- 9 sending the second request to the server.
- 1 5. A method as in claim 4, wherein the server is identified by an SSL (Secure
2 Sockets Layer) context.
- 1 6. A method as in claim 4, wherein said selecting one of a plurality of servers
2 to process the first request comprises using a load balancing algorithm to
3 determine a server to route the first request to.
- 1 7. A method as in claim 4, additionally comprising:
2 determining that the second request comprises non-secure information;
3 and
4 using a load balancing algorithm to determine a server to route the second
5 request to.
- 1 8. A method comprising:
2 receiving a first request comprising a session identifier (I.D.);
3 selecting one of a plurality of servers to process the first request, the
4 server having a unique SSL (Secure Socket Layer) context, and the
5 unique SSL context being associated with an SSL tunnel;
6 mapping the session I.D. to the selected SSL context;
7 sending the first request to the selected server;
8 subsequently receiving a second request comprising the session I.D.;
9 determining that the second request comprises secure information;
10 selecting the SSL context that the session I.D. is assigned to; and
11 sending the second request to the server via the SSL tunnel associated
12 with the SSL context.

1 9. A method as in claim 8, wherein said selecting one of a plurality of servers
2 to process the first request comprises using a load balancing algorithm to
3 determine a server to route the first request to.

1 10. A method as in claim 8, additionally comprising:
2 determining that the second request comprises non-secure information;
3 and
4 using a load balancing algorithm to determine a server to route the second
5 request to.

1 11. A method comprising:
2 receiving a request comprising a session identifier (I.D.);
3 determining if the session I.D. is associated with an SSL (Secure Sockets
4 Layer) context;
5 determining if the request is associated with a secure transaction;
6 if no session I.D. is associated with an SSL context, then selecting one of
7 a plurality of servers to process the first request, the server having
8 a unique SSL (Secure Socket Layer) context, and the unique SSL
9 context being associated with an SSL tunnel; and
10 if the request is associated with a secure transaction, then:
11 mapping the session I.D. to the selected SSL context; and
12 sending the second request to the server via the SSL tunnel
13 associated with the SSL context.

1 12. A method as in claim 11, wherein said selecting one of a plurality of
2 servers to process the request comprises using a load balancing algorithm
3 to determine a server to route the request to.

- 1 13. A method as in claim 11, wherein said determining if the request is
2 associated with a secure transaction comprises determining if an SSL
3 packet is associated with the request.
- 1 14. A method as in claim 11, wherein said determining if the session I.D. is
2 associated with an SSL (Secure Sockets Layer) context comprises looking
3 up the session I.D. in a mapping table to determine if the mapping table
4 comprises an entry for the session I.D. and a corresponding SSL context.
- 1 15. A system comprising a dispatching processor unit to:
2 receive a first request comprising a unique session identifier (I.D.);
3 select a server from a plurality of servers to process the request;
4 assign the unique session I.D. to the selected server, and store the unique
5 session I.D. and corresponding identifier for the selected server in a
6 mapping table comprising entries of session I.D.s each having a
7 corresponding server identifier;
8 send the first request to the selected server;
9 receive a second request comprising the unique session I.D.;
10 find the unique session I.D. in the mapping table; and
11 send the second request to the server corresponding to the unique
12 session I.D. in the mapping table.
- 1 16. A system as in claim 15, wherein a preexisting SSL (Secure Sockets
2 Layer) tunnel exists between the dispatching processor unit and the
3 selected server, the SSL tunnel being identified by an SSL context, and
4 the mapping table comprising entries of session I.D.s each having a
5 corresponding SSL context.
- 1 17. A system as in claim 15, wherein the dispatching processing unit selects

2 one of a plurality of servers to process the request by using a load
3 balancing algorithm to determine a server to route the request to.

1 18. A system as in claim 17, wherein the dispatching processing unit uses a
2 load balancing algorithm to determine a server to route the request to by
3 employing a load balancer.

1 19. A system comprising:

1 a dispatching processor unit to:

2 send client requests to a plurality of servers in a server farm;

3 receive a client request comprising a session identifier (I.D.);

4 determine if state information associated with the session I.D.

5 already exists on one of a plurality of servers in the server
6 farm;

7 send the client request to the server if the state information already
8 exists on a server; and

9 employ a load balancer to determine one of the servers to send the
10 client request to if the state information does not already
11 exist on a server;

12 a load balancer in communication with the dispatching processor unit to
13 determine one of a plurality of servers to send the client request to;
14 and

15 a quality of service (QoS) manager in communication with the dispatching
16 processor unit to decide which one of multiple client requests is
17 processed if multiple client requests are sent to the same server.

1 20. A system as in claim 19, wherein the dispatching processor unit
2 determines if state information associated with the session I.D. already
3 exists on one of a plurality of servers in a server farm by searching a

4 mapping table comprising a session I.D. mapped to a server.

1 21. A system as in claim 20, wherein the session I.D. is mapped to a server by
2 the session I.D. being associated with an SSL (Secure Sockets Layer)
3 context, and the SSL context is associated with the server.

1 22. A machine-readable medium having stored thereon data representing
2 sequences of instructions, the sequences of instructions which, when
3 executed by a processor, cause the processor to perform the following:

4 receive a first request comprising a session identifier (I.D.);

5 select one of a plurality of servers to process the first request;

6 map the session I.D. to the selected server;

7 send the first request to the selected server;

8 subsequently receive a second request comprising the session I.D.;

9 determine that the second request comprises secure information;

10 select the server that the session I.D. is assigned to; and

11 send the second request to the server.

1 23. A medium as in claim 22, wherein the server is identified by an SSL
2 (Secure Sockets Layer) context.

1 24. A medium as in claim 22, wherein the processor selects one of a plurality
2 of servers to process the first request by using a load balancing algorithm
3 to determine a server to route the first request to.

1 25. A medium as in claim 22, the processor to additionally:

2 determine that the second request comprises non-secure information; and

3 use a load balancing algorithm to determine a server to route the second
4 request to.

	1992	1993	1994	1995	1996	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022	2023	2024	2025	2026	2027	2028	2029	2030	2031	2032	2033	2034	2035	2036	2037	2038	2039	2040	2041	2042	2043	2044	2045	2046	2047	2048	2049	2050	2051	2052	2053	2054	2055	2056	2057	2058	2059	2060	2061	2062	2063	2064	2065	2066	2067	2068	2069	2070	2071	2072	2073	2074	2075	2076	2077	2078	2079	2080	2081	2082	2083	2084	2085	2086	2087	2088	2089	2090	2091	2092	2093	2094	2095	2096	2097	2098	2099	2100	2101	2102	2103	2104	2105	2106	2107	2108	2109	2110	2111	2112	2113	2114	2115	2116	2117	2118	2119	2120	2121	2122	2123	2124	2125	2126	2127	2128	2129	2130	2131	2132	2133	2134	2135	2136	2137	2138	2139	2140	2141	2142	2143	2144	2145	2146	2147	2148	2149	2150	2151	2152	2153	2154	2155	2156	2157	2158	2159	2160	2161	2162	2163	2164	2165	2166	2167	2168	2169	2170	2171	2172	2173	2174	2175	2176	2177	2178	2179	2180	2181	2182	2183	2184	2185	2186	2187	2188	2189	2190	2191	2192	2193	2194	2195	2196	2197	2198	2199	2200	2201	2202	2203	2204	2205	2206	2207	2208	2209	2210	2211	2212	2213	2214	2215	2216	2217	2218	2219	2220	2221	2222	2223	2224	2225	2226	2227	2228	2229	2230	2231	2232	2233	2234	2235	2236	2237	2238	2239	2240	2241	2242	2243	2244	2245	2246	2247	2248	2249	2250	2251	2252	2253	2254	2255	2256	2257	2258	2259	2260	2261	2262	2263	2264	2265	2266	2267	2268	2269	2270	2271	2272	2273	2274	2275	2276	2277	2278	2279	2280	2281	2282	2283	2284	2285	2286	2287	2288	2289	2290	2291	2292	2293	2294	2295	2296	2297	2298	2299	2300	2301	2302	2303	2304	2305	2306	2307	2308	2309	2310	2311	2312	2313	2314	2315	2316	2317	2318	2319	2320	2321	2322	2323	2324	2325	2326	2327	2328	2329	2330	2331	2332	2333	2334	2335	2336	2337	2338	2339	2340	2341	2342	2343	2344	2345	2346	2347	2348	2349	2350	2351	2352	2353	2354	2355	2356	2357	2358	2359	2360	2361	2362	2363	2364	2365	2366	2367	2368	2369	2370	2371	2372	2373	2374	2375	2376	2377	2378	2379	2380	2381	2382	2383	2384	2385	2386	2387	2388	2389	2390	2391	2392	2393	2394	2395	2396	2397	2398	2399	2400	2401	2402	2403	2404	2405	2406	2407	2408	2409	2410	2411	2412	2413	2414	2415	2416	2417	2418	2419	2420	2421	2422	2423	2424	2425	2426	2427	2428	2429	2430	2431	2432	2433	2434	2435	2436	2437	2438	2439	2440	2441	2442	2443	2444	2

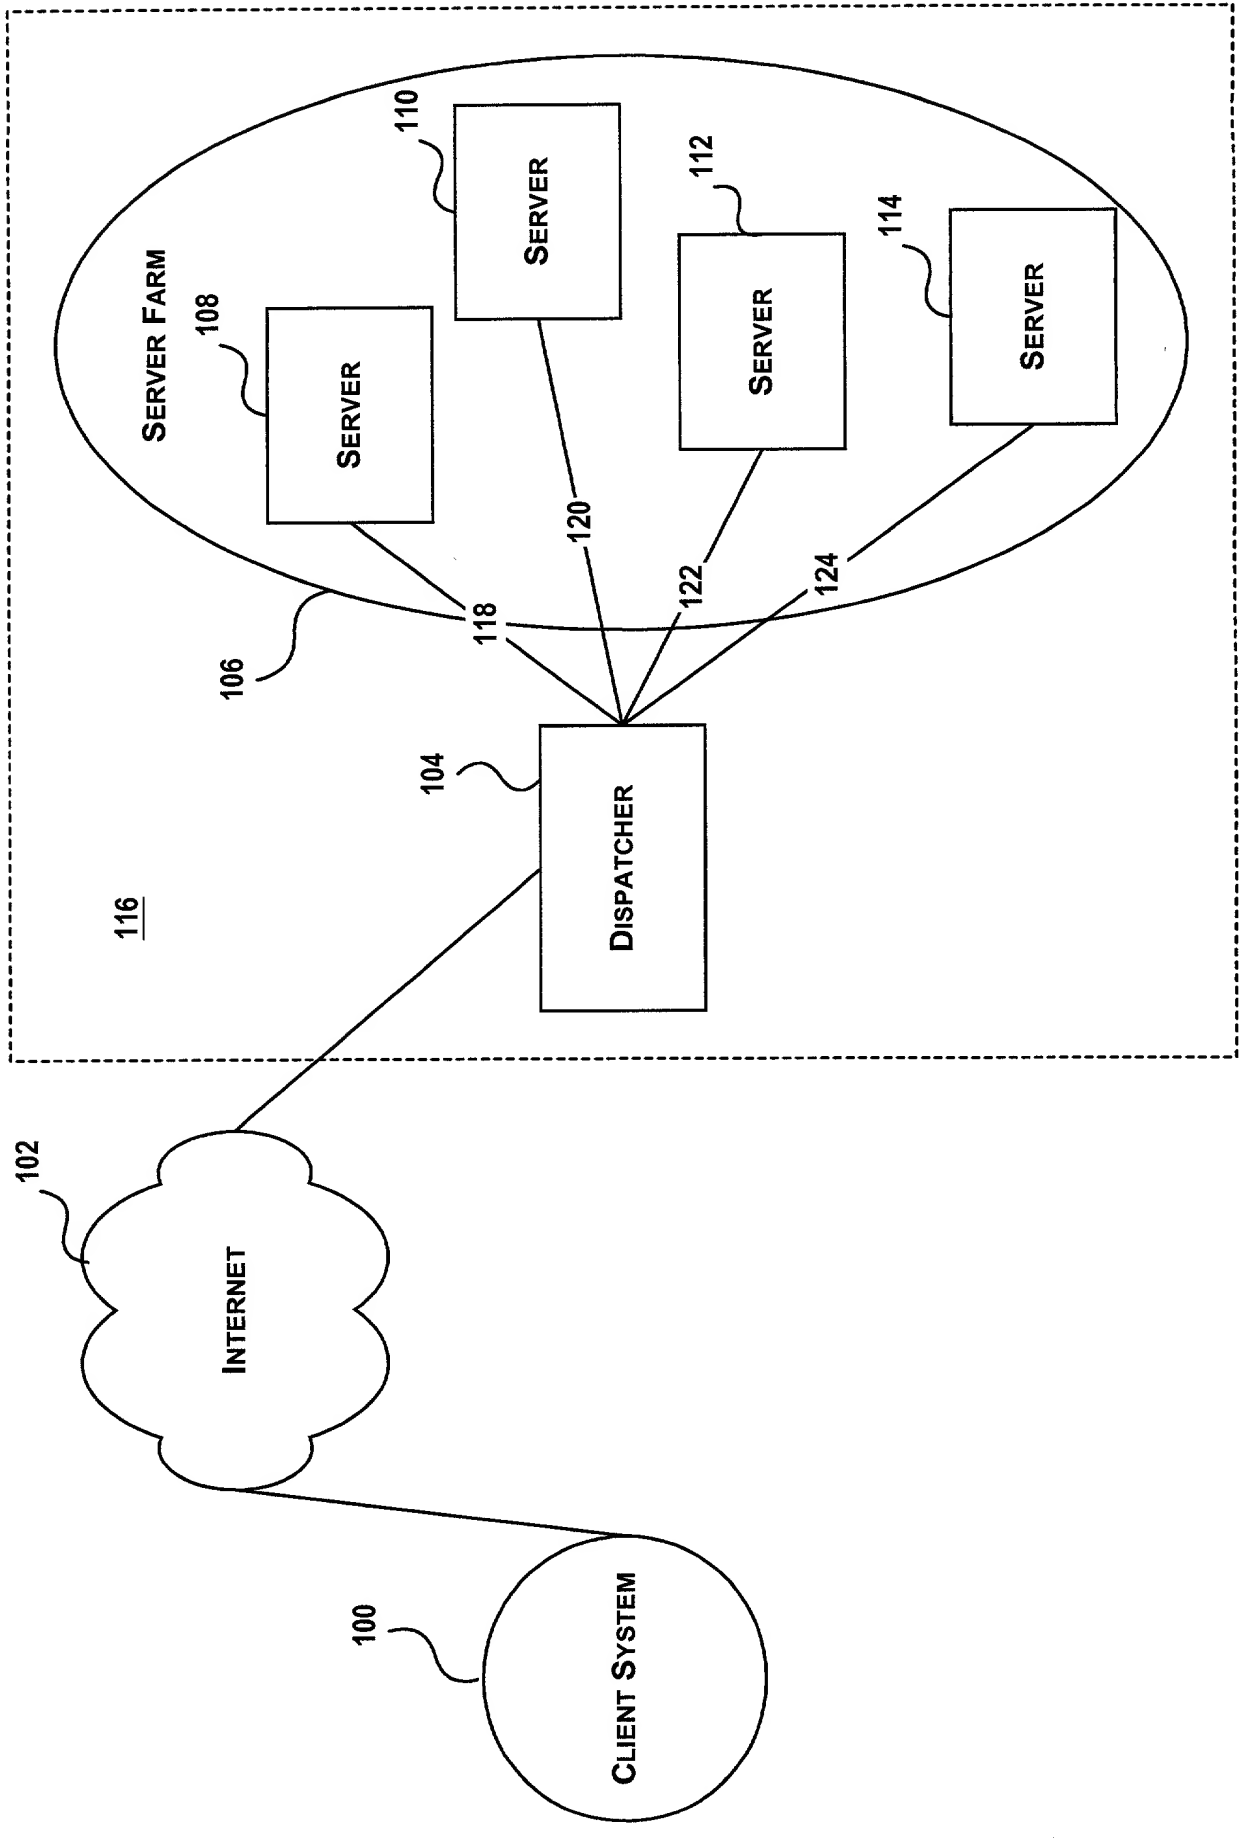

FIG. 1

FIG. 3

FIG. 4

As a below named inventor, I hereby declare that:

I believe I am the original, first, and sole inventor (if only one name is listed below) or an original, first, and joint inventor (if plural names are listed below) of the subject matter which is claimed and for which a patent is sought on the invention entitled

MECHANISM FOR LOCKING CLIENT REQUESTS TO A PARTICULAR SERVER

the specification of which

X is attached hereto.
____ was filed on _____ as
United States Application Number _____
or PCT International Application Number _____
and was amended on _____

(if applicable)

I hereby state that I have reviewed and understand the contents of the above-identified specification, including the claim(s), as amended by any amendment referred to above. I do not know and do not believe that the claimed invention was ever known or used in the United States of America before my invention thereof, or patented or described in any printed publication in any country before my invention thereof or more than one year prior to this application, that the same was not in public use or on sale in the United States of America more than one year prior to this application, and that the invention has not been patented or made the subject of an inventor's certificate issued before the date of this application in any country foreign to the United States of America on an application filed by me or my legal representatives or assigns more than twelve months (for a utility patent application) or six months (for a design patent application) prior to this application.

I acknowledge the duty to disclose all information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, Section 1.56.

I hereby claim foreign priority benefits under Title 35, United States Code, Section 119(a)-(d), of any foreign application(s) for patent or inventor's certificate listed below and have also identified below any foreign application for patent or inventor's certificate having a filing date before that of the application on which priority is claimed:

Prior Foreign Application(s)

Priority
Claimed

_____ (Number)	_____ (Country)	_____ (Day/Month/Year Filed)	<u>Yes</u>	<u>No</u>
_____ (Number)	_____ (Country)	_____ (Day/Month/Year Filed)	<u>Yes</u>	<u>No</u>

I hereby claim the benefit under Title 35, United States Code, Section 119(e) of any United States provisional application(s) listed below:

_____ Application Number	_____ Filing Date
_____ Application Number	_____ Filing Date

I hereby claim the benefit under Title 35, United States Code, Section 120 of any United States application(s) listed below and, insofar as the subject matter of each of the claims of this application is not disclosed in the prior United States application in the manner provided by the first paragraph of Title 35, United States Code, Section 112, I acknowledge the duty to disclose all information known to me to be material to patentability as defined in Title 37, Code of Federal Regulations, Section 1.56 which became available between the filing date of the prior application and the national or PCT international filing date of this application:

_____ Application Number	_____ Filing Date	_____ Status -- patented, pending, abandoned
_____ Application Number	_____ Filing Date	_____ Status -- patented, pending, abandoned

I hereby appoint the persons listed on Appendix A hereto (which is incorporated by reference and a part of this document) as my respective patent attorneys and patent agents, with full power of substitution and revocation, to prosecute this application and to transact all business in the Patent and Trademark Office connected herewith.

Send correspondence to Libby N.Ho, BLAKELY, SOKOLOFF, TAYLOR & ZAFMAN LLP,
12400 Wilshire Boulevard 7th Floor, Los Angeles, California 90025 and direct telephone calls
to (303) 740-1980.

I hereby declare that all statements made herein of my own knowledge are true and that all statements made on information and belief are believed to be true; and further that these statements were made with the knowledge that willful false statements and the like so made are punishable by fine or imprisonment, or both, under Section 1001 of Title 18 of the United States Code and that such willful false statements may jeopardize the validity of the application or any patent issued thereon.

No. 31,710, my patent attorney; with full power of substitution and revocation, to prosecute this application and to transact all business in the Patent and Trademark Office connected herewith.

APPENDIX B

Title 37, Code of Federal Regulations, Section 1.56 Duty to Disclose Information Material to Patentability

(a) A patent by its very nature is affected with a public interest. The public interest is best served, and the most effective patent examination occurs when, at the time an application is being examined, the Office is aware of and evaluates the teachings of all information material to patentability. Each individual associated with the filing and prosecution of a patent application has a duty of candor and good faith in dealing with the Office, which includes a duty to disclose to the Office all information known to that individual to be material to patentability as defined in this section. The duty to disclose information exists with respect to each pending claim until the claim is cancelled or withdrawn from consideration, or the application becomes abandoned. Information material to the patentability of a claim that is cancelled or withdrawn from consideration need not be submitted if the information is not material to the patentability of any claim remaining under consideration in the application. There is no duty to submit information which is not material to the patentability of any existing claim. The duty to disclose all information known to be material to patentability is deemed to be satisfied if all information known to be material to patentability of any claim issued in a patent was cited by the Office or submitted to the Office in the manner prescribed by §§1.97(b)-(d) and 1.98. However, no patent will be granted on an application in connection with which fraud on the Office was practiced or attempted or the duty of disclosure was violated through bad faith or intentional misconduct. The Office encourages applicants to carefully examine:

- (1) Prior art cited in search reports of a foreign patent office in a counterpart application, and
 - (2) The closest information over which individuals associated with the filing or prosecution of a patent application believe any pending claim patentably defines, to make sure that any material information contained therein is disclosed to the Office.
- (b) Under this section, information is material to patentability when it is not cumulative to information already of record or being made of record in the application, and
- (1) It establishes, by itself or in combination with other information, a prima facie case of unpatentability of a claim; or
 - (2) It refutes, or is inconsistent with, a position the applicant takes in:
 - (i) Opposing an argument of unpatentability relied on by the Office, or
 - (ii) Asserting an argument of patentability.

A prima facie case of unpatentability is established when the information compels a conclusion that a claim is unpatentable under the preponderance of evidence, burden-of-proof standard, giving each term in the claim its broadest reasonable construction consistent with the specification, and before any consideration is given to evidence which may be submitted in an attempt to establish a contrary conclusion of patentability.

(c) Individuals associated with the filing or prosecution of a patent application within the meaning of this section are:

- (1) Each inventor named in the application;
 - (2) Each attorney or agent who prepares or prosecutes the application; and
 - (3) Every other person who is substantively involved in the preparation or prosecution of the application and who is associated with the inventor, with the assignee or with anyone to whom there is an obligation to assign the application.
- (d) Individuals other than the attorney, agent or inventor may comply with this section by disclosing information to the attorney, agent, or inventor.
